INSPECTION PROCESS:
Visual appraisal under normal or special lighting

BOUNDARIES OF THE INSPECTION:
The dwelling and it's immediate surroundings within the title boundary on the aforementioned property address. Items inspected are as per the list below.

REPORTING:
Any defects listed in reports will be based on elements that are known to not comply with the following but not limited to; Client supplied project drawings and Specifications, the Building Act 1993, the Building Regulations 2018, National Construction Code/Building Code of Australia Volume Two, AS 4349.0 – 2007 Inspection of buildings, relevant Australian Standards, the Victorian Building Authority Guide to Standards and Tolerances 2015, manufacturers guidelines, and other similar relevant documents.

1.1.3: Perimeter surface drainage

DEFECT

Surface water is not being directed away from footings and collected into surface drainage/ silt pits throughout site.

Photo 9

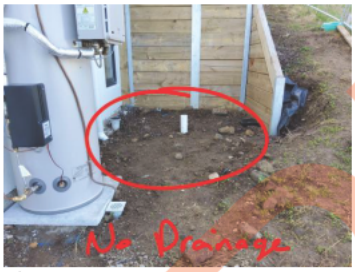

Photo 10

Photo 11

Photo 12

Site drainage is critical to the maintaining equal moisture levels around the the perimeter of the building. Ponding water or inadequate drainage will result in unequal moisture levels and movement of footings and foundations. Specific attention should be made to the Engineering and soil report requirements along with the National Construction Code/Building Code of Australia Volume 2 section 3.1.3.3 Surface water drainage:
"Surface water must be diverted away from Class 1 buildings as follows:
(a) Slab-on-ground — finished ground level adjacent to buildings:
the external finished surface surrounding the slab must be drained to move surface water away from the building and graded to give a slope of not less than (see Figure 3.1.3.2)—
(i) 25 mm over the first 1 m from the building in low rainfall intensity areas for surfaces that are reasonably impermeable (such as concrete or clay paving); or
(ii) 50 mm over the first 1 m from the building in any other case. (b) Slab-on-ground — finished slab heights:
the height of the slab-on-ground above external finished surfaces must be not less than (see Figure 3.1.3.2)—
(i) 100 mm above the finished ground level in low rainfall intensity areas or sandy, well-drained areas; or
(ii) 50 mm above impermeable (paved or concreted areas) that slope away from the building in accordance with (a); or
(iii) 150 mm in any other case."

Photo 56

Photo 57

Other item 2.3.3. 2

1 flagged

SIGNIFICANT DEFECT

Cladding not clear of decking 50mm, confirm manufacturers warranty remains with this type of installation detail.

Refer to page 5 of the james Hardie Scyon™ Cladding installation guidelines under Ground clearances:
"Install James Hardie external cladding with a minimum 150mm clearance to the earth on the

exterior of the building or in accordance with local building codes if greater than 150mm is required. Maintain a minimum 50mm clearance between James Hardie external cladding and roofs, decks, paths, steps and driveways. Adjacent finished grade must slope away from the building in accordance with local building codes, typically a minimum slope of 50mm minimum over the first metre. Do not install external cladding such that it may remain in contact with standing water.
NOTE: Greater clearance may be required in order to comply with termite protection provisions, see below for more information."

Photo 58

DEFECT

End of spreader discharging against rib and not in the direction of flow.

Refer to SA HB 39:2015, Installation code for metal roof and wall cladding, Section 5.7.7 Spreaders:

Spreaders may be used to drain rainwater from a higher roof surface with a catchment area not exceeding 15 m^3 provided the following conditions are satisfied (see Figure 5.7.7):
(a) When discharging onto a tiled roof, the lower section is sarked a minimum width of 1800 mm,

either side of the point of discharge extending down to the eaves gutter.
(b) When discharging onto a corrugated roof, a minimum width of 1800 mm on either side of the point of discharge is sealed for the full length of the side laps.
(c)The increased roof water volume from the upper roof is not to enter any seam of the roof coverings of the lower roof.
(d) No spreader is to discharge roof water onto or over ridge tiles, mortar jointed tiles, flashings, timber fascia or a roof sheet side lap.
(e) No spreader is to have its discharge entering any part of any building.
(f) Spreaders are to discharge all roof water anto roof coverings in the direction of flow, avoiding discharging onto laps on lower roof sheets and tiles. When discharging an upper roof catchment onto a lower roof, the total roof area including the additional upper roof catchment area is to be considered for inclusion when sizing the lower roofing, gutters and downpipes.
(g) Spreaders do not discharge on sheets or tiles discharging to valleys.
NOTE: The spreader catchment area indicated above is based on a standard corrugated roofing profile and may only exceed 15 m^3 provided the additional upper roof discharge does not exceed the lower roof profile manufacturer's design-carrying capacity.

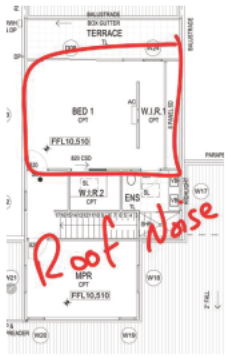

Photo 116

3.0: SERVICES 1 flagged

3.1: GENERAL SERVICES 1 flagged

+3.1.4: Condensate directed to drain?

SIGNIFICANT DEFECT

Condensate drain not connected to stormwater.

Photo 117

Photo 118

Refer to the VBA's Technical Solution Sheet 7.08, 7: Mechanical Services (Including duct heating) which informs practitioners on the requirements for the safe discharge of condensate from split system air-conditioners, and the secure fixing of condenser units. Refer to page 2 that notes:
"The surface must be graded away from the building so that ponding does not occur, and the discharge does not present a safety risk to pedestrians (e.g. across a footpath), nor cause damage to buildings by changing moisture conditions."
Also referring to the CSIRO's "Foundation Maintenance and Footing Performance: A Homeowner's Guide" section Water Service and Drainage:
"Where a water service pipe, a sewer or stormwater drainage pipe is in the vicinity of a building, a water leak can cause erosion, swelling or saturation of susceptible soil. Even a minuscule leak can be enough to saturate a clay foundation. A leaking tap near a building can have the same effect. In addition, trenches containing pipes can become watercourses even though backfilled, particularly where broken rubble is used as fill. Water that runs along these trenches can be responsible for serious erosion, interstrata seepage into subfloor areas and saturation. Pipe leakage and trench water flows also encourage tree and shrub roots to the source of water, complicating and exacerbating the problem. Poor roof plumbing can result in large volumes of rainwater being concentrated in a small area of soil"

5.0: PAINT

Although specific paint defects do not form part of this inspection some items of significance may be commented on and identified by using blue 14 day masking tape. For the clients use/reference the VBA's Guide to Standards and Tolerances section 12.02 states:
"Paintwork is defective if the application has blemishes such as paint runs, paint sags, wrinkling, dust, bare or starved painted areas, colour variations, surface cracks, irregular and coarse brush marks, sanding marks, blistering, non-uniformity of gloss level and other irregularities in the surface that are visible from a normal viewing position. Paintwork is defective if the application results in excessive over-painting of fittings, trims, skirtings, architraves, glazing and other finished edges."

8.0: WET AREAS

8 flagged

8.1: KITCHEN

3 flagged

8.1.3: Cabinetry free from damage

DEFECT

Cabinet chipped around fixing and not covered by cover.

Photo 179

Photo 180

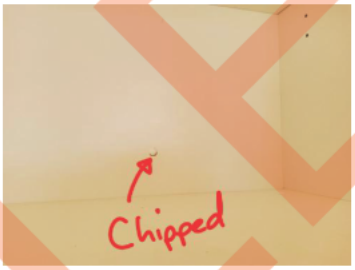

Photo 181

The VBA's Guide to Standards and Tolerance's section 10.06 "Manufactured material" states: "Any cracking, displacement, pitting or similar blemishes in surfaces of manufactured materials are defective if they are caused by the builder and can be seen from a normal viewing position."

8.1.7: Tolerable gaps cupboards/doors/drawers

DEFECT

Cabinet doors not aligned throughout.

Photo 182

Photo 183

The VBA's Guide to Standards and Tolerance's section 10.04 states: "Unless otherwise specified, cabinet door and drawer fronts are defective if they are not aligned, or do not have consistent gaps between them at handover, and can be seen from a normal viewing position."

8.1.8: Plastering; walls/ceiling/cornice (Cracking, bow, finish)

DEFECT

Refer to the VBA's Guide to Standards and Tolerances section 9.13 Level of finish for plasterboard: "Unless documented otherwise, a plasterboard finish is defective if Level 4 finish (as defined below) is not provided: A Level 4 finish shall be the default level for gypsum lining, unless specified otherwise. Flat or low sheen paints shall be used for this Level 4. All joints and interior angles shall have tape embedded in jointing cement/jointing compound and a minimum of two separate coats of jointing cement/jointing compound applied over all joints, angles, fastener heads and accessories. All jointing compound shall be finished evenly and be free of tool marks and ridges in preparation for decoration."
